Introduction:

For this project, I wanted to create a website where you can find clothes similar to those you'd find on the big screen. It would have a home page with a selection of different movies and show options people can choose from, a dedicated page for each option that will have screenshots from the movie/show the person had chosen, and a selection of 'Where to Get It' pages, which will have links to external online shops' websites. On every webpage, there will be a search bar and navigation bar at the top of the page that will take you to the 'About' page, the 'Form' page, and will have the same selection of shows and movies from the home page as dropdown menus. Clicking on the title (also at the top of the page) will take you straight to the home page. Throughout the process, I used different resources to aid me in making the website.

The start:

Once I had finalised the website's purpose and goal and its visual design, I started working on my home page. I started with making the things that would appear on every page, that being the logo, search bar, navigation bar and the footer. I found this to be very difficult as I couldn't understand what the code was doing in the beginning. To help with my understanding, I spent a few days studying HTML and trying to implement what I learned in my code. Eventually, I finished with the top and bottom of the webpage and moved on to making the home page.

Home page:

The home page consists of the following:

- Website logo/title
- Navigation bar
- Search bar
- 'Movie' section with a horizontal scroll list
- 'Show' section with a horizontal scroll list
- Footer

For the home page, I knew I wanted to use a horizontal scroll list so you can scroll through the different movies and shows that would be available. I decided on a horizontal scroll

rather than a vertical one for a number of reasons. One: I feared that if I made them both vertically, the page would become too long. Two: listing them out vertically would leave a lot of space when you view the website on a bigger screen. Three: the lists would become uneven if they didn't have the same number of options.

I also knew that I wanted to use photos for each movie and show. I decided to do this to help those who can remember the movie and/or show in their mind but cannot remember its name. I initially thought about using their logos, but I eventually decided against it and used their posters instead. This was because I believe people are more used to seeing the whole poster rather than just its logo due to the marketing of the movie/show (however this is not always the case. I have noticed that this typically does not apply to movie franchises. A good example of this would be the Harry Potter franchise) and thus using the posters would help them recognise the movie/show more.

About page:

The about page would consist of the following:

- Website logo/title
- Navigation bar
- Search bar
- 'About' section
- 'How to Navigate' section
- Footer

After finishing the home page, I quickly moved on to the about page. I found this to be very easy compared to the home page, since this would only consist of paragraphs. Firstly, I copied the HTML I just made for the home page and deleted the lists. This is so the top and bottom of the webpage (making up the navigation, search and footer) will stay consistent. I also linked this to the navigation bar and the home page to the website logo/title, so you can access it from anywhere on the website (I did this for all the pages). Once that was done, I started on the page's content.

I first worked on the HTML, making sure to include everything I wanted it to have. Again, this was relatively easy as there was nothing complicated to include in the HTML. However, I did have some difficulty with the 'How to Navigate page' and using an ordered list. When I first tried it out, the numbers did not appear, but I eventually fixed it.

For the layout, I decided that I wanted all the paragraphs to be in the centre of the page with some space on the side, so it doesn't touch the edges of the screen. To do this, I tried a few things out and found that setting `<p>` to have width: 75% and margin: auto on CSS did the trick. Setting the width to 75% meant that the text would take up less space on the page, while setting the margin to auto places it in the middle of the screen.

Form page:

The form page would consist of the following:

- Website logo/title
- Navigation bar
- Search bar
- Short message
- Form
- Things to Note
- Footer

The next page I worked on was the 'Form' page. For this website, I wanted to include a form that people can use to suggest any shows and/or movies they wish to include. It would ask for its name and the year of its release, alongside asking if they were suggesting a movie or a show.

Since I have never learned how to make a form in HTML, I tried to find any resources to help explain how to go about it. Initially, I read through some online resources on the different input types and made the form using the ones I thought were most appropriate. This was very simple to complete and had little to no trouble making this page.

Specific movie/show (Mean Girls) page:

The specific movie/show page would consist of the following:

- Website logo/title
- Navigation bar
- Search bar
- A gallery of screenshots from the movie/show
- Footer

Since this website is centred around fashion in media, I knew I needed a way to show the different outfits in shows and movies. With this in mind, I decided to create a gallery of photos, with each one showcasing an outfit (or outfits) from a specific scene. I researched how to make an image gallery and found a tutorial online. I found this quite difficult and was struggling for a bit. In the end, the gallery I made did not turn out as I had envisioned.

Where to get it page:

The specific movie/show page would consist of the following:

- Website logo/title
- Navigation bar
- Search bar
- A screenshot from a movie/show
- Links to external online shops
- Footer

The last page I worked on was the 'Where to Get It' page for one of the photos from the 'Mean Girls' movie page. As stated above, this will have a series of links to clothing items from external online shops.

Despite this being a simple idea, this was a very difficult page for me to do. This is because of the formatting I wanted it to have and the code that I already had. My plan for this page was to have the links on one side and the photo that you clicked on the other. However, this proved to be very difficult for me to execute as the photos and the text were not moving, despite my changing the code. I tried to fix it for a long time but was unsuccessful. I eventually had to start again and used another method to achieve the look I wanted to some degree.

Problems:

Throughout the project, I encountered a number of issues. One example was adjusting the navigation bar for different screen sizes. For smaller screens, instead of the navigation bar at the top, I wanted a side bar that appears when you click/tap on the icon. This was very difficult as this was during the beginning of the project, when I wasn't confident in my understanding of the code. Eventually, I managed to create a functioning navigation sidebar, which is present on the website.

Conclusion:

I set out to create a media fashion website that links to external websites. I wanted it to be consistent with its visual design and to include a way people can interact with it, other than browsing through it. In that respect, I can say that I have achieved my goal. However, I believe that the website I created can be improved upon. If I were to continue developing this, I would spend more time researching and trying to find a way to completely fix the formatting problem in the 'Where to Get It' page. I would also like to include more webpages for the different shows and movies, as this only showcased one scene from one movie.
